SCEC Endorsed Cable Pits

- MANUFACTURERS GUIDE FOR CABLE PITS

Pits are installed by excavating, positioning the pit in the ground and by backfilling. If required, additional pit height may be achieved by adding a riser or plinth. With all installations, ensure compatibility with the surrounding areas and regulatory codes. For more info, visit <u>http://www.acoaus.com.au/education/cablemate/theory-introduction.htm</u> The following is a basic methodology for installing cable pits.

- 1. Excavate greater than overall dimensions of the pit and make allowance for persons working around the area.
- 2. Remove all loose material from excavation. Level and compact base.
- 3. Install pit on a stiff wet concrete base or a foundation of sand or aggregate, depending on the application.

(For <u>split body</u> pits only, position pit floor first, then lower the main pit body onto the floor. The pit body walls should mate into the pit floor rebate. This 10mm rebate allows a closure to prevent soil ingress.)

- 4. Ensure top of pit is level with the finished pavement level. If cover & frames (access covers) are used, top of the pit must be set down beneath pavement.
- 5. The cable area of the pit is generally created through the wall (poly infill Signex) panels.
 - Holes can be formed using hole saws through the panels.
 - Align the cable exit and entry points so that cables can be pulled easily.
 - Allow 50mm from the bottom of the pit to minimise silting.
 - Allow approximately 25-50mm spacing between conduits in the panel.
 - Ensure the clear working area of the enclosure is not impeded and cables protected from damage.
 - Fit all conduit with bushes ensuring they are hard up against the pit wall. Conduits must have sharp edges removed from their internal surfaces.
 - Using a flexible proprietary sealant, seal conduits to prevent ingress of moisture and silt into pit during service. And seal wall (poly infill Signex) panel to pit.
- 6. Backfill the pit with sand or aggregate in layers and compact manually.
